Whisper treated 12,581 children, totalling  
42,897 children since our launch in 2016

1087 children received blood transfusion

Admitted 2,260 seriously sick children, who  
are given free meals

Treated 153 malnourished children

Every patient treated at Whisper  
cost us 135,000 UGX  
in 2019

## ANNUAL REPORT 2019

Whisper raised over 1,7 billion  
shilings just to deliver  
the high quality healthcare  
that our community deserves.

changing healthcare  
through love and happiness

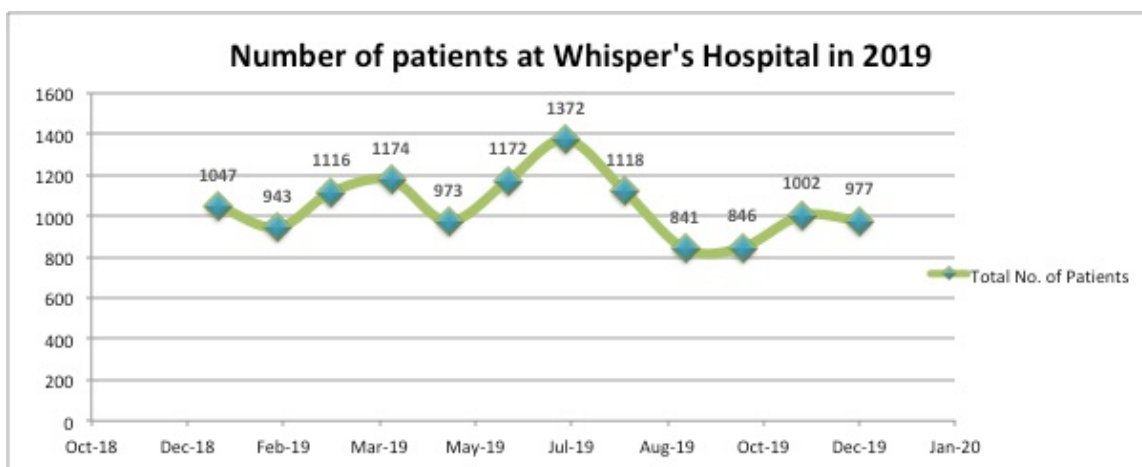

*Since Whisper launch, we successfully healed on 222 burns victims*

*Whisper also funded 5 heart surgeries for our patients and works on taking two pediatric patients for a heart surgery to the USA in 2018 & and two other patients in 2019.*

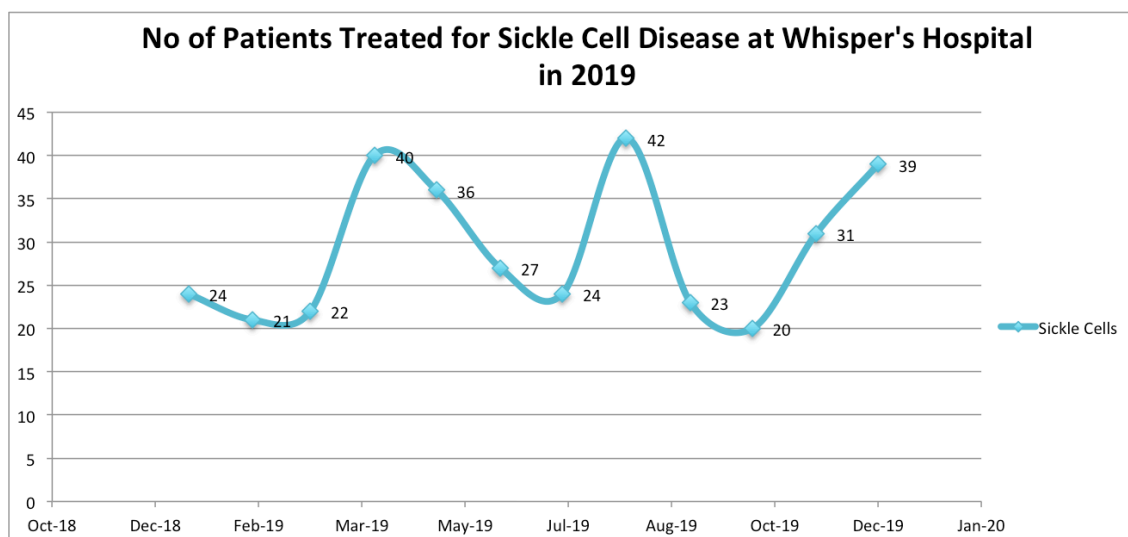

## Our Success Rate in 2019 shows:

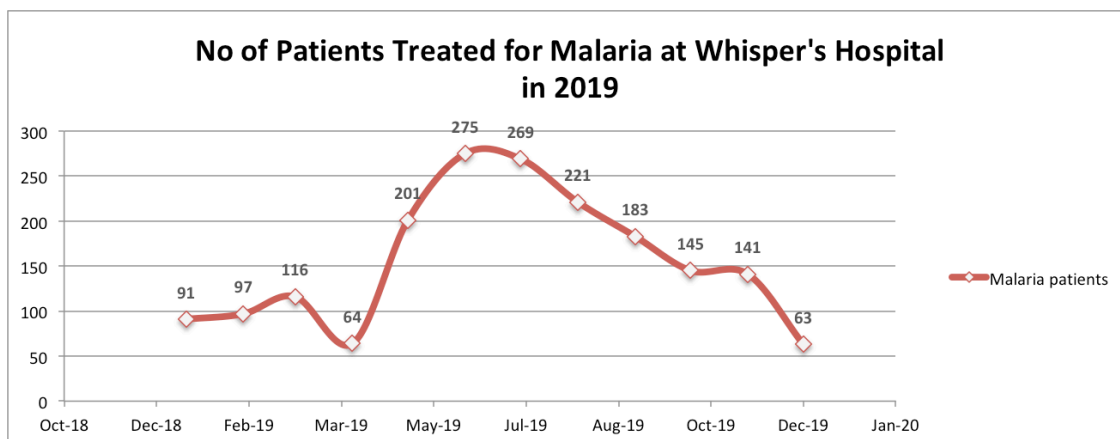

1. Total number of patients treated in 2019: **12,581**

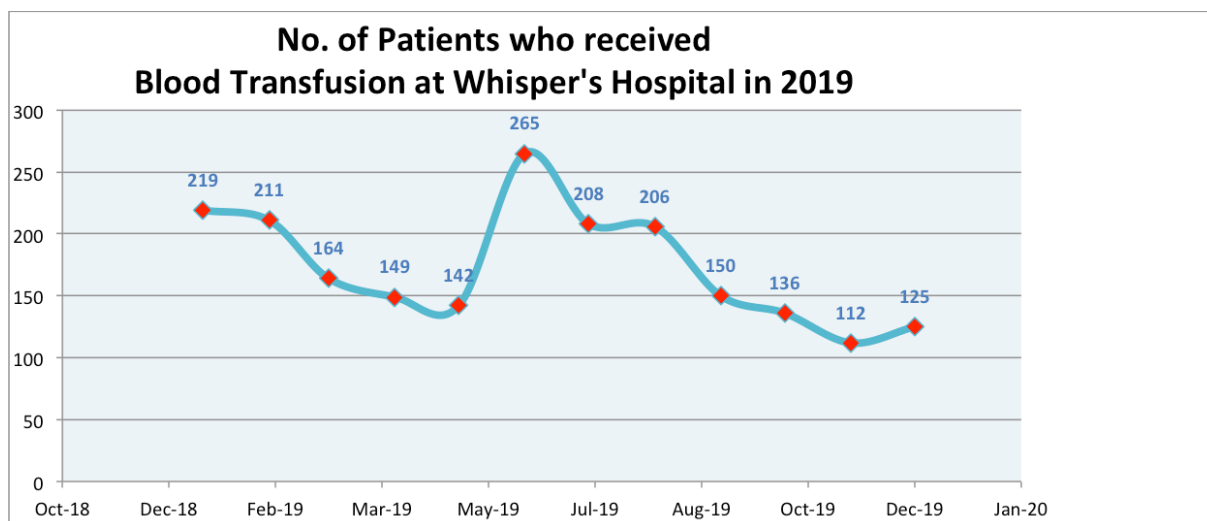

2. Total number of patients treated in 2019: **349**

**3. Total number of patients treated for Malaria in 2019: 1,866**

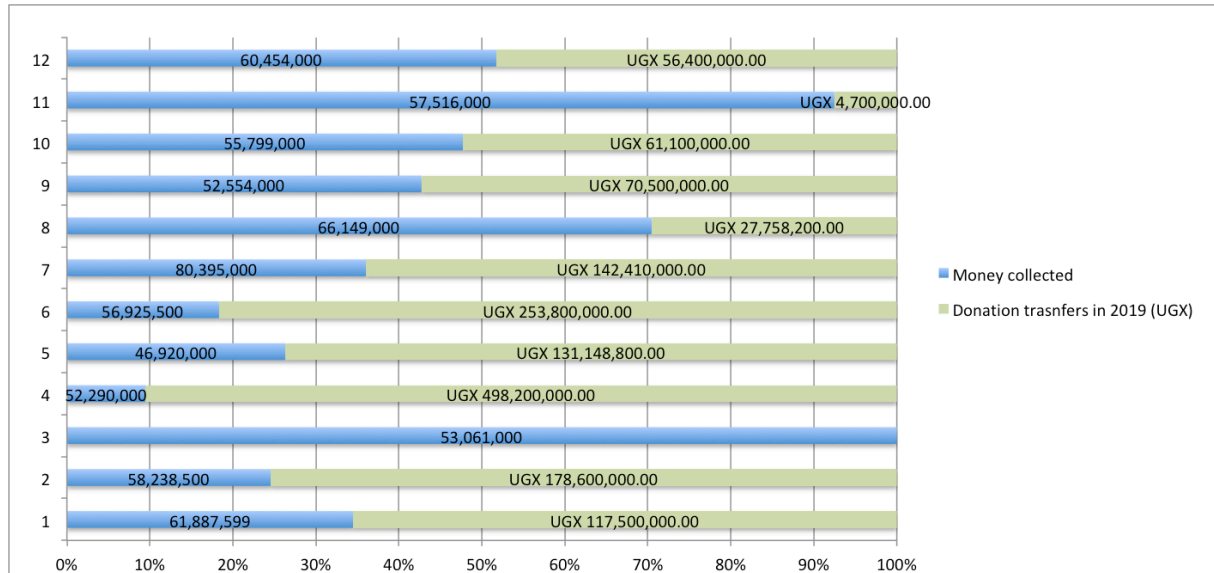

**4. Total number of blood transfusion in 2019: 2,087**

*Funding of the project:*

Above chart shows the amount of funding (in green) Whisper gets comparing how much money it generates with its minimum hospital charges.

Whisper's Magical Children's Hospital

Plot no: 32 Madhvani Road, Jinja

Whisper, The Union for Child Care, Outreach and Education, reg. International NGO, Uganda

### **FIELD REPORT FROM APRIL TO DECEMBER 2019**

*Despite of the increasing technological advancement including ultra sound imaging, maternal and perinatal mortality globally has not decreased and indeed in some developing countries like Uganda there is an increase.*

*The major causes of maternal mortality include abortion related complications, haemorrhage from various conditions, hypertensive disorders, thrombo embolism, obstructed labour, prolonged labour, ruptured uterus and puerperal infections.*

*Causes of perinatal mortality include, prematurity, birth asphyxia, congenital malformations, IUGR, traumatic delivery and cord prolapse.*

*A significant number of these conditions that lead to maternal death also lead to perinatal death. It is worthy that these mortality cases are conditions for which timely ultrasound imaging could be of immense help in early diagnosis and hence intervention leading to reduction of mortality rates among mothers and their babies.*

*It is also noted that most of these avoidable deaths occurring developing countries where ultrasound imaging is currently underutilized and financial constraints have been cited as the main reason. The usefulness of ultrasound imaging in preventing these needless deaths has not been fully exploited.*

*Low resource settings could benefit by prudent application of this modern technology, which is a relatively affordable, and safe imaging modality.*

*Ultrasonography play among role in diagnosing ectopic pregnancies, abortion, gestational trophoblastic diseases in first trimester.*

*The purpose of solography in second and third trimesters is to exclude findings associated with fetal chromosomal abnormalities, pre term deliveries, IUGR, pre-enclapsia, antepartum haemorrhage, hypertensive disorders, thrombus embolism, chorioamniotitis, cardiac disease, anaemia and rupture of uterine sac. These are diagnosed by performing Doppler studies.*

*Despite a recent decline, the maternal mortality ratio MMR of 343 per 100000 live births ( WHO 2018, UNICEF 2016) still accounts for 18% of all deaths among women aged 15-49 years ( government of Uganda, 2017). Especially in rural areas most women do not have access to contraceptives, antenatal care, a skilled attendant at birth, diagnosis during pregnancy like ultrasound and post natal care, furthermore poverty and low level of education are risk factors. Although child marriage is illegal, almost half of under 18 years old girls are married in Uganda (UNICEF, 2017). Frequently adolescent pregnancies are the consequence, bearing duplication of risk of maternal mortality compared to women in their 20s.*

*The majority of pregnancies in Uganda are unintended. However, while abortions are legal under certain circumstances medical providers are often reluctant to perform them, out of fear of legal consequences. This leads to limited access and unsafe abortions which often have fatal consequences. Furthermore, post abortion care must be expanded, improved to half MMR from unsafe abortions*

Doctors have lauded Uganda government efforts and interventions to bring down the under-five mortality rate from 101 to 53 deaths per 1000 live birth between 2006 to 2016. But at least 336 deaths per 100000 live births the country's maternal mortality rate is still among the highest on the continent and in the world.

NGOs like Whispers have put in place free ultrasound scans to pregnant mothers' mostly in rural areas with an objective of bringing down the high maternal mortality rate to a negligible figure. This is aimed at diagnosing any abnormality during pregnancy that may return into a threat during birth and also providing free labor care to all mothers who cannot afford to pay for high delivery costs in Uganda

### TABLE SHOWING TOTAL NUMBERS OF SCANNED MOTHERS
